

Agricultural Data Analysis & Visualization in R

Lily Northcutt
Data Scientist

Chile Pepper Conference 2026
 New Mexico
February 5, 2026

Hi 🙌, I'm Lily

I'm a data scientist with an academic background in Mathematics and Machine Learning.

I've worked with NMSU's Chile Breeding Program & CPI, as well as NMSU's Entomology, Plant Pathology, and Weed Science group.

I primarily work in python now but I started programming with R and I still love the language.

When I'm not working can find me trying to pet dogs on a hike, singing karaoke (poorly), learning to knit, and trying out new restaurants!

Working With Data

Part 1

1. Setting up the environment
2. Reading in data
3. Tidy and Transform our data
4. Summarize the data

- This is an **interactive** and **hands-on** workshop!
- Not a lecture - be vocal, ask questions
- Need help?
 - Your Resources: Talk to your neighbor, **google**, ask me, [R for Data Science Book](#), [R Cheatsheets](#)
- **There are stickers**

This slide means you
have work to do!

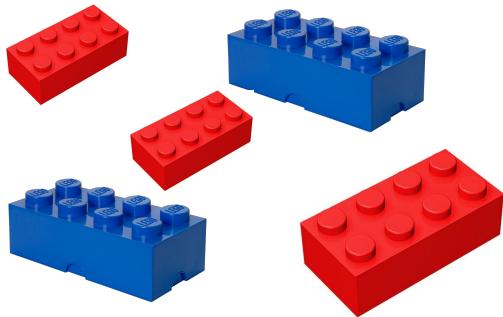

(practice run)

Introduce yourself to your
neighbors

My Goal

My goal is to introduce some of (what I consider to be) the **essential** building blocks for working in R.

Through practice and creativity, you will be able to use the blocks to make something spectacular

you

What
you will
build

What R provides

Section A: Intro

R is a programming language

- Free, open-source programming language for statistics
- Widely used in agricultural research, data analysis, modeling
- Great for reproducibility - your code is your methods section!

RStudio is an Integrated Development Environment (IDE)

- The user-friendly interface to using R!

The screenshot shows the RStudio interface with several panels:

- Top Left Panel:** An R script titled "Untitled1" containing the following code:

```
1 ######
2 ### This is the R script #####
3 #####
```
- Top Right Panel:** The Environment pane showing "Global Environment" with the message "Environment is empty".
- Middle Left Panel:** A plot area containing a single black arrow pointing diagonally upwards and to the right.
- Middle Right Panel:** A file browser showing the directory structure: Home > Documents > RProjects > chile_workshop_feb2026. It includes tabs for Files, Plots, Packages, Help, Viewer, and Presentation.
- Bottom Left Panel:** The Console tab showing the R version (R 4.3.3) and the current working directory (~/Documents/RProjects).

Large blue text labels are overlaid on the interface:

- Q1** is positioned below the arrow in the plot area.
- Q2** is positioned above the file browser panel.
- Q3** is positioned below the arrow in the plot area.
- Q4** is positioned to the left of the file browser panel.

1:31 # (Untitled) R Script

Console Terminal Background Jobs

R 4.3.3 · ~/Documents/RProjects/

Quick Demo: Ways to run code in RStudio

1. Console code

- a. Type `2 + 2` in console → Enter

2. Create a new .R file

- a. File → New File → R Script
- b. Type `2 + 2` in script, highlight, click "Run" (or Ctrl/Cmd + Enter)
- c. Now press Source

What shows up in
the console?

Scripts are saved and reproducible, console is typically for a quick line of code!

Section B: Project Set-Up

Github Repo

github.com/lilynorthcutt/chile_workshop_feb2026

Step 1: Navigate to my personal github repo for this workshop

(use link above or use QR or use bit.ly link)

Step 2: Go into the `working_with_data` folder and find the `problems.R` file

bit.ly/4kgUqqV

Quick Demo: Project Set-Up

1. Create a project
 - a. File → New Project → New Directory → New Project
2. (Install your Packages)
 - a. To install the "dplyr" package you would run:
 - i. `install.packages("dplyr")`
3. Open an .R file

What kind of data can R use?

- Built-in datasets & Downloaded Package datasets
- CSV files (.csv)
- Excel files (.xlsx, .xls)
- Text files (.txt)
- Database connections (SQL)
- Web data (APIs, web scraping)

TODAY: We're using package datasets (`agridat`)

Follow Along Demo in RStudio

1. Load the Package
2. Explore the `agridat` Documentation in the Help Tab

```
# TODO: Follow along reading in data:  
# 1. Load Required Package  
library("agridat")  
  
# Explore the agridat documentation  
?agridat
```

Follow Along Demo in RStudio

1. Read in the yates.oats data
2. Check out the quick ways to view our data

Q: If you were a researcher and this was your experiment, what questions would you want to know?

Section C: Working with Data Basics

Tidyverse

Tidy data is a way to organize tabular data in a consistent data structure across packages.
A table is tidy if:

A	B	C

&

A	B	C

Each **variable** is in its own **column**

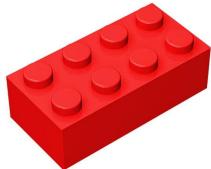

A	B	C
Y	Y	Y
Y	Y	Y

Access **variables** as **vectors**

A	*	B	→	C

Preserve **cases** in vectorized operations

Accessing Columns and Basic Functions

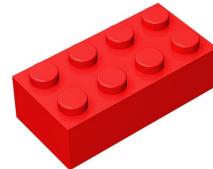

1. Access>Select our Columns

Concept: Data frames are like spreadsheets with named columns

Two ways to access columns:

- dollar sign: oats\$yield
- bracket notation: oats[, "yield"]

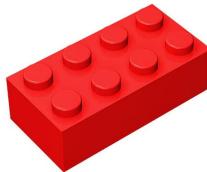

2. Basic Functions

- mean()
- median()
- sum()
- sd() - standard deviation
- length() - count of values

Demo in RStudio

PROBLEM 1 in the code

filter()

Concept: Selects specific ROWS based on the conditions you set

In order to specify your conditions, you will use:

Comparison Operators

- == means "equals" (not =)
- ! means NOT
- > < >= <= for comparisons

Combining Operators

- & means "and"
- | means "or"

```
(nitro > 0.2) & (gen == "Marvelous")
```

Translates to:

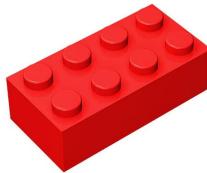

```
gen != "Marvelous" &  
(grain > 30 | straw > 30)
```

Translates to:

Demo in RStudio

PROBLEM 2 in the code

mutate()

Concept: Creates NEW columns or modifies existing ones in your dataset

- We will use our previous blocks we acquired inside of mutate to build something bigger and better

case_when()

Concept: Similar to if/else statement that takes many conditions.

```
case_when(  
  condition1 ~ "Category 1",  
  condition2 ~ "Category 2",  
  condition3 ~ "Category 3",  
  TRUE ~ "Everything else"  
)
```

```
case_when(  
  nitro == 0 ~ "Control",  
  nitro <= 0.2 ~ "Low",  
  nitro <= 0.4 ~ "Mid",  
  TRUE ~ "High"  
)
```

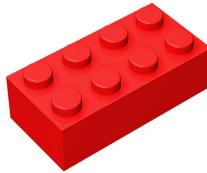

Translate to:

Demo in RStudio

Section C: Data Basics

PROBLEM 3 in the code

merge ()

Concept: Combining datasets by matching rows on common column(s)

Think of it like adding additional information from a different table based on something in common - will commonly be metadata

Example: We may merge a key with full variety or treatment names into a large datasets from a trial

Important! *The matching column must have THE SAME NAME in both datasets*

`data.frame()`

Instead of only reading in data, we can always custom create it in R

Demo in RStudio

Section C: Data Basics

v_3	n_3 156	n_2 118	
v_1	n_1 105		
v_3	n_0 130		
v_2	n_3 157		
v_3	n_0 117	n_1 114	
v_2	n_2 161	n_3 141	
v_3	n_2 104	n_0 70	
v_1	n_1 89	n_3 117	
v_3	n_3 1	$B4$	74
v_2	n_1 81		
v_3	n_1 103	n_0 64	
v_2	n_2 132	n_3 133	
v_2	n_1 108	n_2 126	
v_3	n_2 149	n_0 70	
v_3	n_3 1	$B5$	24
v_2	n_2 96		
v_3	n_2 89	n_1 102	
v_1	n_2 86		
v_3	n_0 64		
v_2	n_2 132	n_3 124	
v_3	n_1 129	n_0 89	
v_2	n_1 108	n_2 126	
v_3	n_2 149	n_0 70	
v_3	n_3 1	$B6$	24
v_1	n_2 96		
v_3	n_0 61	n_3 100	
v_1	n_1 91	n_2 97	

↔ rows →

Area of each plot : 1/80 acre. (28·4 links \times 44 link rows.)

FIG. 2.

Oats Variety and Manuring Experiment.
Plan and yields in quarter lb.

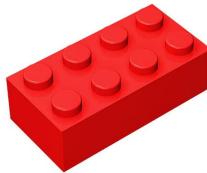

Graphic: <https://academic.oup.com/jrsssb/article/2/2/181/7026418?login=false>

PROBLEM 4 in the code

Your Turn 26

Section D: Summarizing Data

summarize()

Concept: Collapses your dataset down to whatever type of summary you specify

This will commonly be things like mean(), min(), max(), nrow()

group_by()

summarize() really SHINES when used with group_by()

Concept: Calculate summaries FOR EACH GROUP instead of the whole dataset

PROBLEM 5

BONUS CHALLENGE!

Your Turn  30

Exploring & Visualizing Data

Part 2

1. Using %>% operator
2. Intro to ggplot2
 - a. Scatter plots + Customizing
 - b. Other Plots + Error Bars
 - c. Faceting

Carte Figurative des pertes successives en hommes de l'Armée Française dans la campagne de Russie 1812-1813.
Dressée par M. Minard, Inspecteur Général des Ponts et Chaussées en retraite.

Paris, le 20 Novembre 1869.

Les nombres d'hommes présents sont représentés par les largeurs des zones colorées à raison d'un millimètre pour dix mille hommes; ils sont de plus écrits en travers des zones. Le rouge désigne les hommes qui ont été en Russie, le noir ceux qui en sortent. Les renseignements qui ont servi à dresser la carte ont été pris dans les ouvrages de M. M. Chiers, de Segur, de Fezensac, de Chambray et le journal médical de Jacob, pharmacien de l'Armée depuis le 28 Octobre.

Pour mieux faire juger à l'œil la diminution de l'armée, j'ai supposé que les corps du Prince Sébastien et du Maréchal Davout, qui avaient été défaits sur Minsk et Mohilow et qui rejoignirent Orléans en Witebsk, avaient toujours marché avec l'armée.

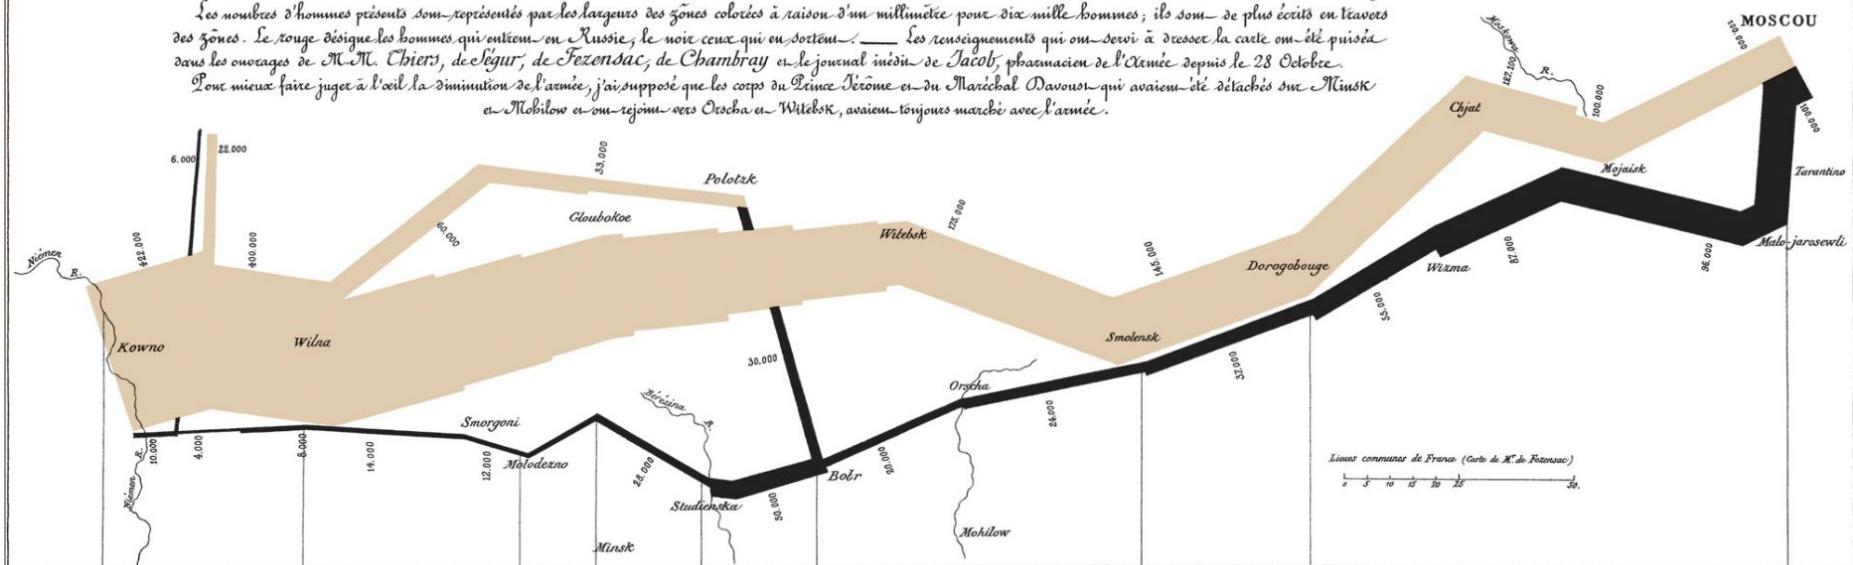

TABLEAU GRAPHIQUE de la température en degrés du thermomètre de Réaumur au dessous de zéro.

Les cosaques passent au galop
le Niémen gelé.

Avec la Régie, 8, Rue St^e Marie St^e G^e à Paris.

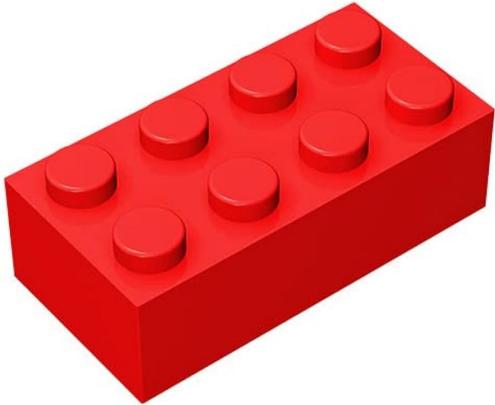

Imp. Litt. Régisier et Bourdet.

Map by Charles Joseph Minard

<https://ageofrevolution.org/200-object/flow-map-of-napoleons-invasion-of-russia/>

- This is an **interactive** and **hands-on** workshop!
- Will be faster paced than last section
- Need Help?
 - Your Resources: Talk to your neighbor, google, ask me, [R for Data Science Book](#), [R Cheatsheets](#)
- There are still stickers!

Section A: Pipe Operator %>%

Pipe operator: %>%

Problem: Nested code is hard to read, constantly assigning new variables is not sustainable

Solution: %>%

Concept: A way to chain operations together so code reads like a sentence

“... and then ...”

Basic Syntax:

```
data %>%  
  function1() %>%  
  function2() %>%  
  function3()
```

Demo in RStudio

Section A: Pipe

(There is another pipe: |> it is virtually the same)

PROBLEM 1

Section B: Intro to ggplot2

<https://ggplot2-book.org/facet.html>

<https://rstudio.github.io/cheatsheets/data-visualization.pdf>

What is ggplot2?

Library for creating graphics
based on "The Grammar of
Graphics"

ggplot2 Building Beautiful Plots

We build plots in 3 main layers:

1. Data
 - a. What data are you plotting?
2. Aesthetics (aes)
 - a. x-axis & y-axis
 - b. shape
 - c. color
 - d. size
 - e. fill
3. Geoms (how the data will be plotted)

a. Scatter plot	geom_point()
b. Boxplot	geom_boxplot()
c. Barchart	geom_bar()
d. Heatmap	geom_tile()

Unfortunately I can't go through every plot.....

But I can show the iterative process for improving one single plot, which can be applied to all other ggplots!

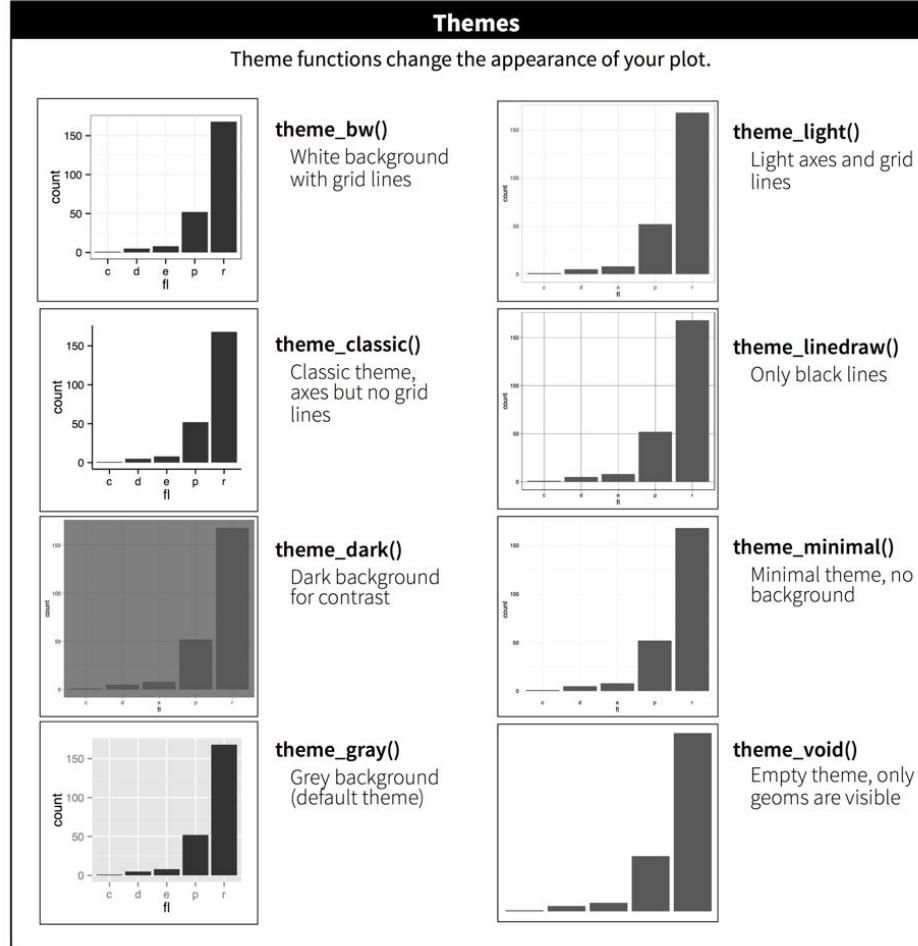

We will take 1 plot and improve it over multiple iterations

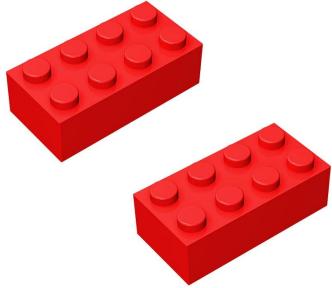

PROBLEM 2

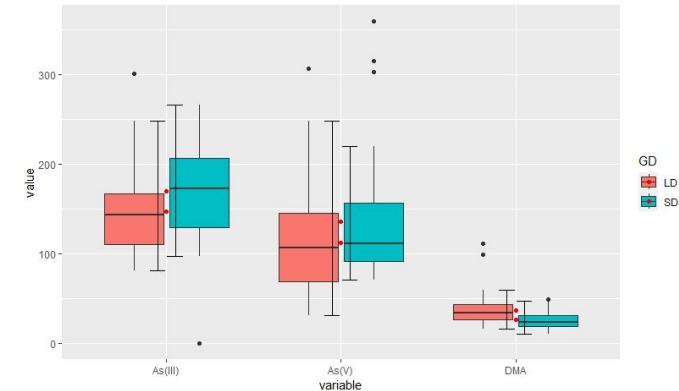

Themes

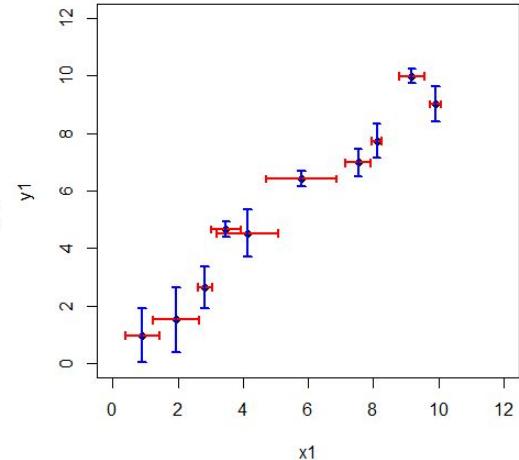

Section C: More Plots

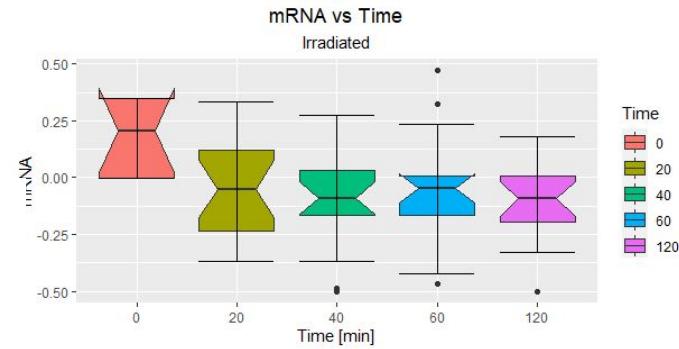

Boxplots and Error Bars (examples)

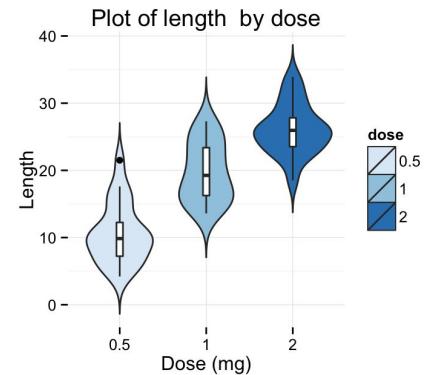

<https://forum.posit.co/t/adding-error-bar-and-mean-value-in-box-plot-with-multiple-variables/174908>

<https://chitchatr.wordpress.com/2013/06/25/add-error-bars-to-a-plot-in-r/>

<https://stackoverflow.com/questions/63860118/why-doesnt-ggplot-show-the-error-bar-of-a-boxplot>

https://www.sthda.com/english/wiki/ggplot2-violin-plot-quick-start-guide-r-software-and-data-visualization#google_vignette

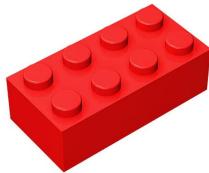

Demo in RStudio

Section C: More plots

PROBLEM 3

Section D: Faceting

Faceting ❤️

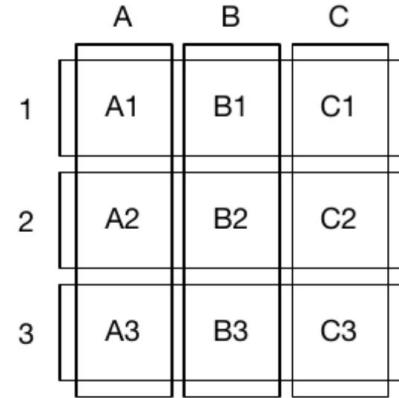

Concept: Plot subplots by the group(s) of your choosing

Why it's so great:

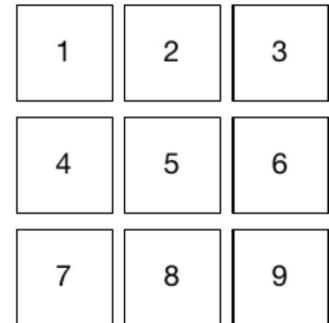

- Separate panels for each group
- Compare patterns side-by-side
- Professional, publication-quality

There are three types of faceting:

- `facet_null()`: a single plot, the default.
- `facet_wrap()`: “wraps” a 1d ribbon of panels into 2d.
- `facet_grid()`: produces a 2d grid of panels defined by variables which form the rows and columns.

facet_grid

facet_wrap

Demo in RStudio

<https://ggplot2-book.org/facet.html>

Section D: Faceting

PROBLEM 4

Bringing it all together!

Question 1:

Did any locations in the field have higher yields?

Question 2:

What's the best variety x nitrogen combination?

Lily's 2 cents

1. Use .Rdata - super helpful and can save time
2. Never use a pie chart
3. Marker Understanding: Color > Size > Shape
4. Good figures + graphics can take as much time as the analysis
5. Take time to explain
